Usina Coruripe Reports BRL 507.2 Million in EBITDA year-to-date for the 2026/27 Crop Season

The cumulative performance through September of the 2026/27 crop season at **Coruripe Mill** was marked by significant improvements in operational indicators. This is a direct reflection of the quality of the investments made and demonstrates the efficiency of its operational processes. Cumulative sugarcane crushing reached **10.58 million tons**, representing a **9.4% increase** compared to the same period of the previous crop season. In the agricultural segment, the main highlight was the **19.1% increase in ATR (Total Recoverable Sugar) per hectare**, evidencing substantial productivity gains and a greater capacity to generate value per cultivated area. These results reinforce the Company's competitiveness and demonstrate consistent advances in both raw material quality and agricultural performance.

In the industrial segment, the Company maintained its growth trajectory, increasing equivalent sugar production by 8.5%, while ethanol production grew 24.0% compared to the same period of the previous crop season. This performance demonstrates Coruripe's ability to capture operational gains through a more efficient production mix aligned with market opportunities, further strengthening its competitive position within the industry.

The more challenging pricing environment for marketed products limited the conversion of operational gains into revenue and margins throughout the period. Nevertheless, the recent recovery in international sugar prices is noteworthy, with the NY sugar contract once again trading above 21.1 cents per pound, accumulating an appreciation of approximately 17.6% over the last month. Coruripe delivered a solid operational performance, supported by increased production, agricultural and industrial efficiency, and rigorous cost management. This performance reinforces the resilience of the Company's operating model and its ability to generate results in less favorable market conditions, reflected in an **Adjusted EBITDA of BRL 507.2 million**.

From a financial perspective, the Company achieved a significant strategic milestone through the strengthening of its capital structure. The monetization of credits related to the IAA/4870 legal claim generated a liquidity event totaling BRL 1.5 billion, contributing to a substantial reduction in net debt. **Net debt decreased from BRL 3.6 billion to BRL 2.8 billion**. In addition to accelerating the deleveraging process, this transaction enhanced the Company's liquidity, strengthened its financial indicators, and created more favorable conditions for access to new funding sources. As a result, the Company gained greater flexibility to support growth and maintain the consistency of its operational performance.

In summary, Coruripe Mill enters the 2026/27 crop season supported by solid operational fundamentals, significant productivity gains, and a substantially stronger capital structure. Even in a less favorable pricing environment, the Company continues to demonstrate operational resilience, strong execution capabilities, and enhanced financial flexibility. As a result, it is strategically positioned to capture value, strengthen its competitiveness, and sustain growth in the coming cycles.
